AL ALB365

Integration Guide

Live Sports Streaming

Embed live video of thousands of matches per month. Event ids are the same as in the Odds Feed, so every stream maps to its match automatically.

API base	Format	Updated
https://radar.albet365.xyz	JSON	27 November 2026

1. Access

Item	Value
Base URL	`https://radar.albet365.xyz`
Authentication	Header `Authorization: Bearer <API key>` on **both** `/matched-events` and `/generate-token` — server-side only
Player domains	The player opens only on the website domains registered for your account (and their sub-domains). The browser must send a `Referer` (do not use `referrerpolicy="no-referrer"`); embed it in an `<iframe>` or open it in a new tab.
IP whitelist	API calls only from your registered server IPs. The player link itself opens in the viewer's browser.

2. Matches with a live stream

`GET` `/matched-events`

```
{ "status": "success", "data": [ "sr:match:12345678", "sr:match:12345679", … ] }
```

Refresh every 30–60 seconds on your server and show a TV icon on the listed matches.

3. Create a player link

`POST` `/generate-token`

```
// request
{ "eventId": "sr:match:12345678" }
// response
{ "status": "success",
  "data": { "singleUseUrl": "/token/eyJ…", "url":
"https://radar.albet365.xyz/token/eyJ…", "expiresIn": 600 } }
```

Show `data.url` in an iframe:

```
<iframe src="https://radar.albet365.xyz/token/eyJ…" allow="autoplay; fullscreen"
allowfullscreen
        style="width:100%;aspect-ratio:16/9;border:0"></iframe>
```

Important. The link is **single-use** and valid for about 10 minutes. Create it only when a viewer opens the stream — never in advance, never shared between viewers.

---

4. Recommended flow

1. **Backend** polls `GET /matched-events` every 30 s and caches the list.
2. **Frontend** shows a TV icon next to the listed matches (from your own backend).
3. Viewer clicks → frontend calls **your backend** → your backend calls `POST /generate-token`.
4. Your backend returns `data.url`; the frontend puts it in the iframe.

```
// Express (your backend)
app.post('/api/stream-url', async (req, res) => {
  const r = await fetch('https://radar.albet365.xyz/generate-token', { method:
'POST',
    headers: { Authorization: 'Bearer ' + process.env.API_KEY, 'Content-Type':
'application/json' },
    body: JSON.stringify({ eventId: req.body.matchId }) });
  const j = await r.json();
  if (!r.ok) return res.status(r.status).json({ error: j.message });
  res.json({ streamUrl: j.data.url });
});
```

5. Limits

Endpoint	Limit
`/matched-events`	60 requests / minute
`/generate-token`	up to 20 links / minute per account (shared fairly when many partners are live at once) — request a link only when a viewer clicks "watch"
`/token/{token}`	single use, 10 minutes, no IP restriction (opens in the viewer's browser)

6. Errors

HTTP	Meaning
400	Event ID is required / not in the form `sr:match:123`
401	Token is required
403	Invalid token, IP not whitelisted, service not enabled · player: token already used
404	No stream for this match right now · player: token expired or invalid
429	Too many links per minute
502 / 503	Temporarily unavailable — retry

```
{ "status": "error", "message": "No stream for this event right now" }
```
